

AWS Internship Interview Questions & Answers (Easy Language)

1. What is AWS?

AWS (Amazon Web Services) is a cloud platform that provides servers, storage, databases, and many other services over the internet. It helps companies avoid buying physical hardware.

2. What is EC2?

EC2 (Elastic Compute Cloud) lets you run virtual machines (servers) in the cloud. You can launch, stop, and manage them easily.

3. What is S3?

S3 (Simple Storage Service) is used to store files, such as documents, images, or backups. It is safe, scalable, and cheap.

4. What is IAM?

IAM (Identity and Access Management) is used to manage who can access AWS services. You can create users and give them specific permissions.

5. What is a region and availability zone?

AWS has data centers in many locations called regions. Each region has multiple data centers called availability zones (AZs) for high availability.

6. What is a VPC?

VPC (Virtual Private Cloud) is your own private network in AWS. You can control IP addresses, subnets, firewalls, and gateways.

7. What is the difference between public and private subnet?

Public subnet allows internet access (for example, web servers). Private subnet is hidden from the internet (for example, databases).

8. What is the use of an elastic IP?

Elastic IP is a static public IP address that you can attach to an EC2 instance. It does not change

even if the instance is stopped or restarted.

9. What is RDS?

RDS (Relational Database Service) helps you run databases like MySQL or PostgreSQL without managing the database software or hardware.

10. What is Lambda?

AWS Lambda lets you run code without managing servers. You only pay for the time your code runs.

11. What is Auto Scaling?

Auto Scaling automatically increases or decreases EC2 instances based on traffic. It saves cost and improves performance.

12. What is CloudWatch?

CloudWatch is used to monitor AWS services and send alerts if something goes wrong (like high CPU usage).

13. What is the difference between S3 and EBS?

S3 is for storing files (object storage). EBS is like a hard disk used with EC2 (block storage).

14. What is an AMI?

AMI (Amazon Machine Image) is a snapshot of an EC2 instance. You can use it to launch new instances with the same setup.

15. What is a security group?

A security group is like a firewall. It controls which traffic is allowed in and out of your EC2 instances.
